MILLIONS die every year from superbug infections because the medical establishment won't dare talk about CHLORINE DIOXIDE, which kills superbugs

08/04/2023 // Ethan Huff // 5.7K Views

Antibiotic-resistant "superbugs" are on the rise globally, and are now killing more people every year than HIV/AIDS or malaria

"That resistance out there is actually now one of the leading causes of death in the world," says Dr. Chris Murray, director of the Institute for Health Metrics and Evaluation.

The author of a new study on the subject that was published in the United Kingdom journal *The Lancet*, Murray found that in the year 2019 alone, drug-resistant infections directly killed at least 1.2 million people in the study pool, and about five million people worldwide.

Murray and his colleagues set out to quantify the degree to which antibiotic resistance is afflicting the world. They discovered that superbugs are mutating to evade antibiotic pharmaceuticals at a much faster rate than many researchers had previously determined.

"These deadly new strains of bacteria are causing untreatable blood infections, fatal pneumonia, relentless urinary tract infections, gangrenous wounds and terminal cases of sepsis, among other conditions," reports *NPR*.

Sub-Saharan Africa sees most superbug deaths, Australia the least

While it used to be the case that this systemic failure of antibiotics was just a "first world" problem, it has now spread to the third world as well. Pretty much everywhere is now afflicted with antibiotic resistance, which represents a serious threat to human survival.

"In the past, we all thought that you had to be rich enough to use a lot of antibiotics inappropriately to have this problem," Murray says. "But that's not the case."

Sub-Saharan Africa leads the pack for clocking the most deaths directly from superbugs: about 24 deaths per 100,000 people annually. In high-income countries, conversely, the average fatality rate is about 13 per 100,000 people.

Australia currently clocks the lowest mortality rate from drug-resistant superbugs with just six deaths per 100,000 people.

Right in the middle is Latin America, where frequency of superbug deaths is dependent upon the types of antibiotics that are used in a given country or area.

"We do have a very high frequency of resistance to different types of antibiotics, first line and second line [antibiotics]," says Fiorella Krapp Lopez, an infectious disease physician in Lima, Peru. "And the problem has been increasing in the last years."

patients with bloodstream infections or very severe pneumonia. So unfortunately, it's across the full spectrum of bacterial infectious diseases right now in Peru."

Lopez contributed to Murray's study, providing data specifically on drug-resistant microbes in Peru. She says the problem is much harder to address than many people think, especially when antibiotics are readily available, even to people who do not have a prescription.

Antibiotic overuse is something that was programmed into the masses particularly in the Western world as the solution to just about every health problem. Doctors used to prescribe antibiotics for pretty much everything, including *viral* infections – and now here we are with a growing superbug pandemic.
